## lab- oxysen Chemical reactions

There are four basic chemical reactions that involve atmospheric oxygen. You will investigate 3 of these reactions in this lab.

## materials:

2- 400 mL beakers

Salt
nail
<

Plastic spoon
Candle
Bromothymol Blue Solution
straw

## Procedures:

## L.Rust:

- Fill a 400 mL beaker to 100 mL of water. Add salt and stir until no more salt will dissolve.
- Place your nail in the salt water and let it sit for at least 10 minutes.

## ---while your experiment is sitting, complete the following experiments---

 ${ }_{2}$ COmbustion:- Raise your hand and ask your teacher to light your candle
- Watch the candle for 1 minute.
- Cover the candle with the beaker.

Watch what happens and record: $\qquad$

## 3.Cellular Respiration:

- Fill a beaker with 50 mL tap water.
- Add a dropper full of Bromothymol Blue solution. (Bromothymol Blue Solution is an indicator that is Blue in the presence of Oxygen gas and turns Green in the presence of Carbon Dioxide Gas).
- Blow into the water solution with a straw for about 30 seconds to a minute.

Watch what happens and record:

## *****Take your nail out of the salt water and sit it on a paper towel. Clean up your lab station and return to class.

## questions:

1. The absence of what element made your flame go out?
2. The presence of what compound made your indicator change color?

The chemical equation for rust is: $4 \mathrm{Fe}(s)+3 \mathrm{O}_{2}(g)==>2 \mathrm{Fe}_{2} \mathrm{O}_{3}(s)$
3. What are the reactants?
4. What are the products?
5. What was the purpose in adding SALT to your water?
